| Pola Dusung         | adalah bentuk dan jenis tanaman budidaya (pertanian) dan tanaman kehutanan (MPTs) pada suatu unit lahan tertentu yang dapat bermanfaat secara ekonomis dalam jangka waktu tertentu.   |
| Klaster pola dusung | adalah penentuan dan pengelompokan jenis tanaman secara spasial sesuai kriteria dan parameter unit lahan dan berdasarkan petuanan hak ulayat Desa/Negeri di wilayah Pulau Ambon.  |
| Lahan               | adalah suatu wilayah permukaan bumi yang khususnya meliputi semua benda penyusun biosfer yang dapat dianggap bersifat tetap atau siklis di atas dan di bawah wilayah tersebut meliputi atmosfer, tanah, dan batuan induk, topografi, air, masyarakat, tumbuh-tumbuhan, dan binatang, serta akibat dari aktivitas manusia di masa lalu mempunyai pengaruh yang nyata atas penggunaan lahan di masa sekarang dan masa yang akan datang. |
| Unit Lahan          | adalah sebidang tanah yang ditentukan, dikelompokan dan ditetapkan sesuai faktor pembatas yang sama berdasarkan kriteria dan parameter tertentu.  |
| Satuan Lahan        | adalah pengelompokan tanah kedalam unit lahan sebagai satu satuan kriteria dan satu satuan parameter. Satuan lahan adalah suatu areal dari lahan yang dapat dibedakan pada peta dan mempunyai kekhususan pada sifat-sifat lahan dan kualitas lahan.   |
| Kualitas lahan      | adalah sifat-sifat pengenalan ( <i>attribute performance</i> ) yang bersifat kompleks ( <i>complex of land atribut</i> ) dari sebidang lahan dan mempunyai pengaruh nyata terhadap kesesuaian lahan untuk penggunaan tertentu.  |

|   |  |
|---|--|
| Karakteristik Lahan                             | adalah faktor-faktor lahan yang dapat diukur atau ditaksir besarnya.   |
| Kesesuaian lahan aktual                         | adalah kesesuaian lahan berdasarkan data sifat biofisik tanah atau sumber daya lahan sebelum lahan tersebut diberikan masukan-masukan yang diperlukan untuk mengatasi kendala.   |
| Kesesuaian lahan potensial                      | adalah kesesuaian lahan yang akan dicapai setelah dilakukan usaha-usaha perbaikan lahan berupa masukan sesuai dengan tingkat pengelolaan yang akan diterapkan sehingga dapat diduga tingkat produktivitas dari suatu lahan serta hasil produksi per satuan luas.   |
| Tipe Penggunaan Lahan                           | adalah tipe penggunaan lahan yang diperinci sesuai dengan syarat-syarat teknis untuk suatu daerah dengan keadaan fisik dan social ekonomi tertentu.  |
| Evaluasi Lahan                                  | adalah membandingkan persyaratan yang diperlukan untuk suatu penggunaan lahan tertentu dengan sifat sumberdaya yang ada pada lahan tersebut.   |
| Evaluasi Kesesuaian Lahan                       | adalah penilaian kualitas lahan berdasarkan karakteristik dan persyaratan lahan untuk penggunaan tertentu.   |
| Pendekatan parametrik dalam evaluasi kesesuaian | lahan adalah pemberian nilai pada tingkat pembatas yang berbeda pada sifat lahan, dalam skala normal diberi nilai maksimum 100 hingga nilai minimum 0.   |
| Pendekatan pembatas                             | adalah suatu cara untuk menyatakan kondisi lahan atau karakteristik lahan pada tingkat kelas, dimana metode ini membagi lahan berdasarkan jumlah dan intensitas pembatas lahan.  |
| Pembatas lahan                                  | adalah penyimpangan dari kondisi optimal karakteristik dan kualitas lahan yang memberikan pengaruh buruk untuk berbagai penggunaan lahan.  |
| SIG   | adalah suatu komponen yang terdiri dari perangkat keras, perangkat lunak, data geografis dan sumberdaya manusia yang bekerja bersama secara efektif untuk menangkap, menyimpan, memperbaiki, memperbaharui, mengelola, memanipulasi, mengintegrasikan, menganalisa, dan menampilkan data dalam suatu informasi berbasis geografis. |
| Analisis Spasial                                | adalah suatu teknik atau proses yang melibatkan sejumlah hitungan dan evaluasi logika (matematis) yang dilakukan dalam   |
