LAMPIRAN 1

NASKAH PENJELASAN UNTUK MENDAPAT PERSETUJUAN DARI KELUARGA/SUBYEK PENELITIAN

Analisis kadar malondialdehide pada anak dengan thalassemia beta

Thalasemia mengacu pada sekelompok kelainan genetik produksi rantai globin di mana terdapat ketidakseimbangan antara produksi rantai α-globin dan β-globin. 3% populasi dunia gen pembawa β-thalasemia. Indonesia termasuk salah satu negara dalam sabuk thalasemia dunia, yaitu negara dengan frekuensi gen thalasemia yang tinggi. Hal ini terbukti dari penelitian epidemiologi di Indonesia yang mendapatkan bahwa frekuensi gen thalasemia beta berkisar 3-10%.

Transfusi yang dilakukan terus-menerus pada thalassemia dapat menyebabkan kelebihan besi dalam tubuh (iron overload). Besi yang jumlahnya meningkat ini, dalam bentuk ferrous iron (Fe^{2+}) dapat mengalami reaksi Fenton yang membentuk radikal bebas, menyebabkan stres oksidatif dengan salah satu akibatnya adalah peroksidasi lipid. Peroksidasi lipid dapat mengurai lipid menjadi malondialdeide (MDA). Peroksidasi lipid membran dapat mengganggu fungsi dan integritas sel normal. Maka pengukuran produk peroksidasi lipid adalah cara yang umum untuk menggambarkan stres oksidatif. Peroksidasi lipid dapat diukur dengan pengukuran kadar MDA yang merupakan produk peroksidasi.

Kami bermaksud mengadakan penelitian untuk menilai kadar malondialdeide pada pasien thalassemia beta. Kami menjamin bahwa penelitian ini tidak menimbulkan efek samping terhadap anak/kemenakan bapak/ibu, bahkan diharapkan hasil

penelitian ini akan bermanfaat untuk penanganan pasien thalasemia beta dan mencegah komplikasi lebih lanjut akibat kerusakan organ yang disebabkan stress oksidatif . Bila ibu/bapak setuju untuk berpartisipasi diharapkan ibu/bapak dapat memberikan persetujuan secara tertulis.

Kami akan menanyakan dan mencatat identitas anak/kemenakan ibu/bapak (nama, alamat, tanggal lahir, jenis kelamin). Selanjutnya akan dilakukan pemeriksaan meliputi pengukuran berat badan dan tinggi badan, pemeriksaan tekanan darah, nadi, pernapasan dan suhu badan. Pemeriksaan fisik secara keseluruhan akan dilakukan. Kami akan melakukan pemeriksaan kadar malondialdehide dengan cara mengambil sampel darah sebanyak 1-2 ml melalui pembuluh darah dengan menggunakan sput 3 ml. Pemeriksaan dilakukan 1 kali selama durasi penelitian berlangsung. Pemeriksaan ini tanpa dipungut biaya.

Keikutsertaan anak/kemenakan ibu/bapak dalam penelitian ini bersifat suka rela tanpa paksaan, karena itu ibu/bapak bisa menolak ikut atau berhenti ikut dalam penelitian ini tanpa takut akan kehilangan hak untuk mendapat pelayanan kesehatan yang dibutuhkan oleh anak/kemenakan ibu/bapak.

Semua data dari penelitian ini akan dicatat dan dipublikasikan tanpa membuka data pribadi anak/kemenakan ibu/bapak. Data pada penelitian ini akan dikumpulkan dan disimpan dalam file manual maupun elektronik, diaudit dan diproses serta dipresentasikan pada:

- Forum ilmiah Program Pasca Sarjana (S2) Universitas Hasanuddin
- Publikasi pada jurnal Ilmiah dalam negeri/ luar negeri

Setelah membaca dan mengerti atas penjelasan yang kami berikan mengenai pentingnya pemeriksaan kadar malondialdehide, kami harapkan untuk menandatangani surat persetujuan mengikuti penelitian. Atas kesediaan dan kerjasamanya saya mengucapkan banyak terima kasih.

FORMULIR PERSETUJUAN MENGIKUTI PENELITIAN

Setelah mendengar, mengikuti dan menyadari pentingnya penelitian ini maka saya yang bertanda tangan di bawah ini :

Nama :

Umur :

Alamat :

Dengan ini menyatakan secara sukarela tanpa paksaan setuju untuk mengikutsertakan anak saya dalam penelitian ini:

Nama :

Umur :

Demikian surat persetujuan ini dibuat dengan sebenarnya untuk digunakan sebagaimana mestinya.

Makassar, 2022

Orangtua,

Lampiran 3

PROSEDUR PENGAMBILAN SAMPEL

Pencatatan data sampel

Semua penderita yang memenuhi syarat dicatat: nama, umur, jenis kelamin, berat badan, tinggi badan, dan status gizi.

Pengukuran berat badan menggunakan timbangan injak digital yang sudah ditera dengan ketelitian 0,1 kg. Pengukuran tinggi badan menggunakan microtoise dengan ketelitian 0,1 cm. Status gizi ditentukan berdasarkan berat badan menurut tinggi badan sesuai standar baku NCHS. Pencatatan data sampel dilanjutkan dengan pemeriksaan kadar 25-hidroksi vitamin D darah

Prosedur Pemeriksaan

1. Pengambilan sampel didahului dengan pemberian penjelasan kepada orang tua tentang tujuan dan manfaat penelitian, cara pengukuran status gizi dan cara pengambilan darah. Kemudian orang tua diminta untuk mengisi dan menandatangani surat persetujuan sebagai tanda bersedia menjadi peserta pada penelitian ini.

2. Semua anak yang memenuhi kriteria inklusi dan bersedia untuk ikut dalam penelitian ini sebagai subjek penelitian dilakukan pencatatan nama, umur, dan jenis kelamin.
3. Pengukuran berat badan menggunakan timbangan digital yang sudah distandarisasi, dapat menimbang anak dengan kapasitas maksimum 150 kilogram dengan tingkat ketelitian 100 gram. Sebelum menimbang, diperiksa lebih dahulu dengan melakukan kalibrasi, apakah alat sudah dalam keadaan seimbang (jarum menunjukkan angka 0). Penimbang badan dalam posisi berdiri tanpa sepatu namun masih menggunakan seragam sekolah. Pencatatan berat badan dalam kilogram.
4. Pengukuran tinggi badan menggunakan microtoise dengan ketelitian 0,1 sentimeter. Dapat mengukur tinggi badan anak dengan kapasitas maksimum 200 sentimeter dan ketelitian 0,1 sentimeter. Pengukuran dilakukan dengan posisi tegak, kepala tidak menunduk, wajah serta panjangan mata lurus ke depan, kedua lengan berada disamping, bahu, bokong dan tumit menyentuh papan pengukur, kedua kaki dan lutut lurus, serta pengukuran tidak menggunakan alas kaki (Franfurt plane horizontal). Pembacaan tinggi badan dalam sentimeter.
5. Penilaian obes pada anak menggunakan parameter indeks massa tubuh (IMT). Indeks Massa Tubuh (IMT) dihitung dengan cara membagi berat badan dalam satuan kilogram dengan tinggi badan kuadrat dalam meter dan dinyatakan dalam kg/m² kemudian diklasifikasikan menurut kurva pertumbuhan CDC — NCHS untuk usia > 2 tahun berdasarkan

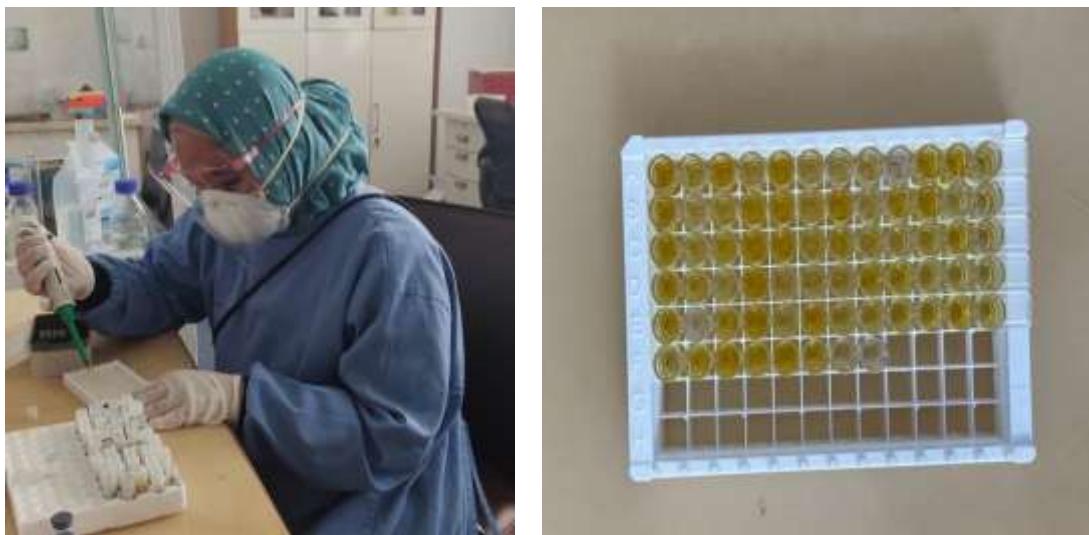

umur dan jenis kelamin, anak masuk dalam kriteria obes jika IMT terhadap umur diatas persentil ke-95.

6. Dilakukan pengambilan sampel darah, melalui pembuluh darah vena dengan menggunakan sputit disposable 3 cc setelah sebelumnya dilakukan pemasangan tourniquet dan teknik disinfektan dengan kapas alcohol 70%. Pengambilan sampel darah sebanyak 1-2 cc dimasukan kedalam tabung sampel darah warna merah lalu dilakukan sentrifus dalam 30 menit setelah pengumpulan sampel. Semua sampel darah diletakan pada cooler box berisi ice pack dengan suhu 2-8°C derajat dapat bertahan 8-72 jam, kemudian sampel dibawa ke laboratorium HUMRC.
7. Persiapan kit pemeriksaan kadar malondialdehyde, kit dan sampel harus dipanaskan secara alami dalam suhu ruangan selama 30 menit.

Gambar 20. Persiapan alat kit dan sampel

8. Sample diletakkan pada plate kemudian diberikan reagen dan cairan ELISA, kemudian dilakukan dinkubasi selama 60 menit dengan suhu 37°C.

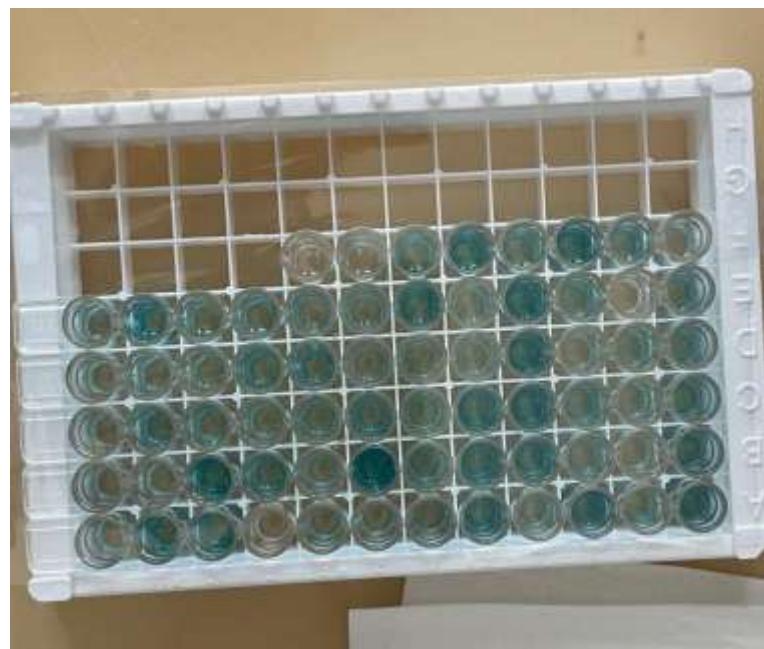

Gambar 21. Sampel yang telah diberikan reagen dan cairan ELISA

Gambar 22. Sampel dilakukan inkubasi selama 60 menit dalam suhu 37°C

9. Cuci plate sebanyak 5 kali. Tambahkan cairan substrat A dan B. Inkubasi selama 10 menit dalam suhu 37°C hingga terjadi perubahan warna. Keringkan plate selama 10 menit, kemudian sample penelitian siap di analisis.

Gambar 21. Sampel yang mengalami perubahan warna setelah penambahan substrat A dan B

NIM : C105172004
Prog. Studi : Dokter Spesialis Ilmu Kesehatan Anak
No. HP : 082312826014
Judul : Analisis Kadar Malondialdehide pada Anak dengan Thalassemia Beta
Jangka Waktu : 26 Juli s.d 26 Oktober 2022
Lokasi : Inst. Pusat Jantung Terpadu (One Day Care); Inst. Gawat Darurat; Perawatan Pinang Atas Belakang.

dengan ketentuan sebagai berikut:

1. Sesuai dengan peraturan dan ketentuan penelitian yang berlaku di lingkup RSUP Dr Wahidin Sudirohusodo
2. Sebelum meneliti, peneliti wajib melapor kepada Pengawas Penelitian di masing-masing unit yang menjadi lokasi penelitian
3. Pelaksanaan penelitian tidak mengganggu proses pelayanan terhadap pasien
4. Pemeriksaan penunjang, BHP dan lain-lain digunakan dalam penelitian, menjadi tanggung jawab peneliti, tidak dibebankan kepada pasien ataupun RS
5. Peneliti melaporkan proses penelitian secara periodik serta hasil penelitian di akhir waktu penelitian
6. Mencantumkan nama RSUP Dr Wahidin Sudirohusodo sebagai afiliasi institusi dalam naskah dan publikasi penelitian
7. Surat Keterangan Selesai Penelitian menjadi salah satu syarat untuk mengikuti Seminar Hasil Penelitian
8. Bukti Penyerahan Skripsi/Thesis/Disertasi ke RSUP Dr Wahidin Sudirohusodo menjadi syarat penyelesaian studi.

Mohon dapat dipastikan agar ketentuan tersebut dipenuhi peneliti sebelum menyelesaikan studi di institusi saudara. Atas perhatian dan Kerjasama yang baik, diucapkan terima kasih.

Tembusan:

1. Kepala Instalasi Gawat Darurat
2. Kepala Instalasi Pusat Jantung Terpadu
3. Instalasi Pelayanan Ibu dan Anak
4. Kepala Sub Instalasi Perawatan Pinang 1.

Lampiran 5. Analisis Data

Jenis Kelamin non-thalassemia

| | | Frequency | Valid Percent | Cumulative Percent |
|-------|-----------|-----------|---------------|--------------------|
