Salah satu parameter yang digunakan untuk menentukan kualitas semen sapi yang akan digunakan untuk inseminasi buatan adalah evaluasi motilitas spermatozoa. Garner and Hafez (2000), menyatakan bahwa syarat minimal motilitas individu semen post thawing yang dapat digunakan dalam inseminasi buatan adalah 40%. Suhu thawing mempengaruhi motilitas semen beku, dan motilitas yang terbaik pada semen beku sapi perah dengan menggunakan suhu thawing 39°C dengan rata-rata nilai motilitas 49,2% dan 37°C dengan rata-rata nilai motilitas 51% selama 30 detik (Zelfina *et al.*, 2012).

Interpretasi Uji Normalitas:

Bila sampel lebih dari 50, maka yang dipakai adalah Kolmogorov-Smirnov, sebaliknya bila sampel ≤ 50 , maka yang dipakai adalah Shapiro-Wilk. Data dikatakan berdistribusi normal apabila nilai $P > 0,05$, sebaliknya data dikatakan tidak berdistribusi normal apabila nilai $P < 0,05$. Data BCS tidak berdistribusi normal dengan nilai $P = 0,000 (< 0,05)$.
